File Edit View Tools Mode Help

Question: Who is happy?

Mary works at University. John works in Ireland. If X works at University then X is happy. If Y works in Ireland then Y is rich.

Paraphrase:
Who is happy?

Tree:
[q0, [ipro, [Who]], [v3, [v0, [cp, [is]]], [c2, [c1, [adj, [happy]]]]]]

DRS:
[whq drs([A, B], [pred(A, [be], B)#C, evtl(A, state)#C, prop([happy], B)#C, obj([who], B)#C, struc(B, D)#C))]

FOL:
[whq~exists(A, exists(B, pred(A, [be], B)#C & (evtl(A, state)#C & (prop([happy], B)#C & (obj([who], B)#C & struc(B, D)#C)))))]

Output Reasoning Engine:
[[pred(sk10(sk6, sk5, A, B), [be], sk8)#[0, 3], prop([happy], sk8)#[0, 3], evtl(sk10(sk6, sk5, C, D), state)#[0, 3], pred(sk9(sk2, sk1), [be], sk4)#[0, 4], prop([rich], sk4)#[0, 4], evtl(sk9(sk2, sk1), state)#[0, 4], var([Y], E)#[0, 4], struc(F, atomic)#[0, 4], var([X], G)#[0, 3], struc(H, atomic)#[0, 3], prop(sk1, [in], sk2, sk3)#[0, 2], pred(sk2, [work], sk4)#[0, 2], struc(sk4, atomic)#[0, 2], struc(sk3, atomic)#[0, 2], role(sk1, location)#[0, 2], named([John], sk4)#[0, 2], named([Ireland], sk3)#[0, 2], evtl(sk2, event)#[0, 2], prop(sk5, [at], sk6, sk7)#[0, 1], pred(sk6, [work], sk8)#[0, 1], struc(sk8, atomic)#[0, 1], struc(sk7, atomic)#[0, 1], role(sk5, location)#[0, 1], named([University], sk7)#[0, 1], named([Mary], sk8)#[0, 1], evtl(sk6, event)#[0, 1]]]

Result Reasoning Engine:
[[named([Mary], sk8)#[0, 1]]]

Logic based CNL

- Formalize discourse through logic and reasoning (FOL or OWL subset)
- Uses a monosemous lexicon and strict syntax interpretation rules to avoid ambiguity
- CNLs are easy to read, but difficult to write (narrow coverage, strict rules)

3D Scene Construction CNL WordsEye

The ground has a grass texture. The ground is pale green. It is partly cloudy. The girl is in front of the house. The girl has red top hat. The woman is facing the girl. The white picket fence is behind the house. The fence is 40 feet wide. Two trees is on left side of house.

Halo Project CPL CNL (Digital Aristotle)

A question from the Advanced Placement Exam in physics:

An alien measures the height of a cliff by dropping a boulder from rest and measuring the time it takes to hit the ground below. The boulder fell for 23 seconds on a planet with an acceleration of gravity of 7.9 m/s². Assuming constant acceleration and ignoring air resistance, how high was the cliff?

Restated in Computer-Processable Language (CPL):

A boulder is dropped. The initial speed of the boulder is 0 m/s. The duration of the drop is 23 seconds. The acceleration of the drop is 7.9 m/s². What is the distance of the drop?

Enter CPL: [\[help\]](#)[\[test\]](#)

A boulder is dropped.
The initial speed of the boulder is 0 m/s.
The duration of the drop is 23 seconds.
The acceleration magnitude of the drop is 7.9 m/s².
What is the distance of the drop?

FrameNet

- Developed in ISCI, Berkley by C.Fillmore et.al.
- Consists of ~800 *frames* (generic situations and objects) and their arguments – *frame elements*
- Derived from extensive text corpus evidence – new frames caused only by unique *argument structure*
- Frames organized in *inheritance* hierarchies
- Largely language independent
 - LexicalUnits assigned to frames
 - back.n (Observable_bodyparts)
 - back.n (Part_orientational)
 - back.v (Self_motion)
 - back.a (Part_orientational)

Bringing

Definition:

This frame concerns the movement of a **Theme** and an **Agent** and/or **Carrier**. The **Agent**, a person or other sentient entity, controls the shared **Path** by moving the **Theme** during the motion. In other words, the **Agent** has overall motion in directing the motion of the **Theme**. The **Carrier** may be a separate entity, or it may be the **Agent's** body. The **Constant location** may be a subregion of the **Agent's** body or (a subregion of) a vehicle that the **Agent** uses.

Karl **CARRIED** the books across campus to the library on his head.

Karl **CARRIED** the books across campus to the library in his truck.

Karl **CARRIED** the books across campus to the library by truck.

The truck **CARRIED** the books across campus to the library in specially designed boxes.

The FEs include **Path**, **Goal**, and **Source**. **Area** is an area that contains the motion when the path is understood as irregular. This frame emphasizes the path of movement as opposed to the FEs Source or Goal as in Filling or Placing.

FEs:

Core:

Agent [Agt]
Semantic Type Sentient
The **Agent** is a sentient being who physically controls the movement of the **Theme** via the carrier, accompanying the **Theme**.

Karl **CARRIED** the books across the campus to the library.

Area [Area]

Area is used for description of a general area in which the carrying action takes place when the motion is understood to be irregular or not to consist of a single, linear path.

Carrier [Car]

The **Carrier** provides support for the **Theme**. Movement of the **Carrier** results in movement of the **Theme**.

The boat **FERRIED** the troops across the river.

Goal [goa]

Semantic Type Goal

Goal identifies the endpoint of the path.

Karl **CARRIED** the books to the library.

Path [Path]

Path along which carrying occurs.

Karl **CARRIED** the books across the campus.

Source [sou]

Semantic Type Source

Source indicates the beginning of the path along which the **Theme** travels.

Karl **HAULED** the books from the library to the office.

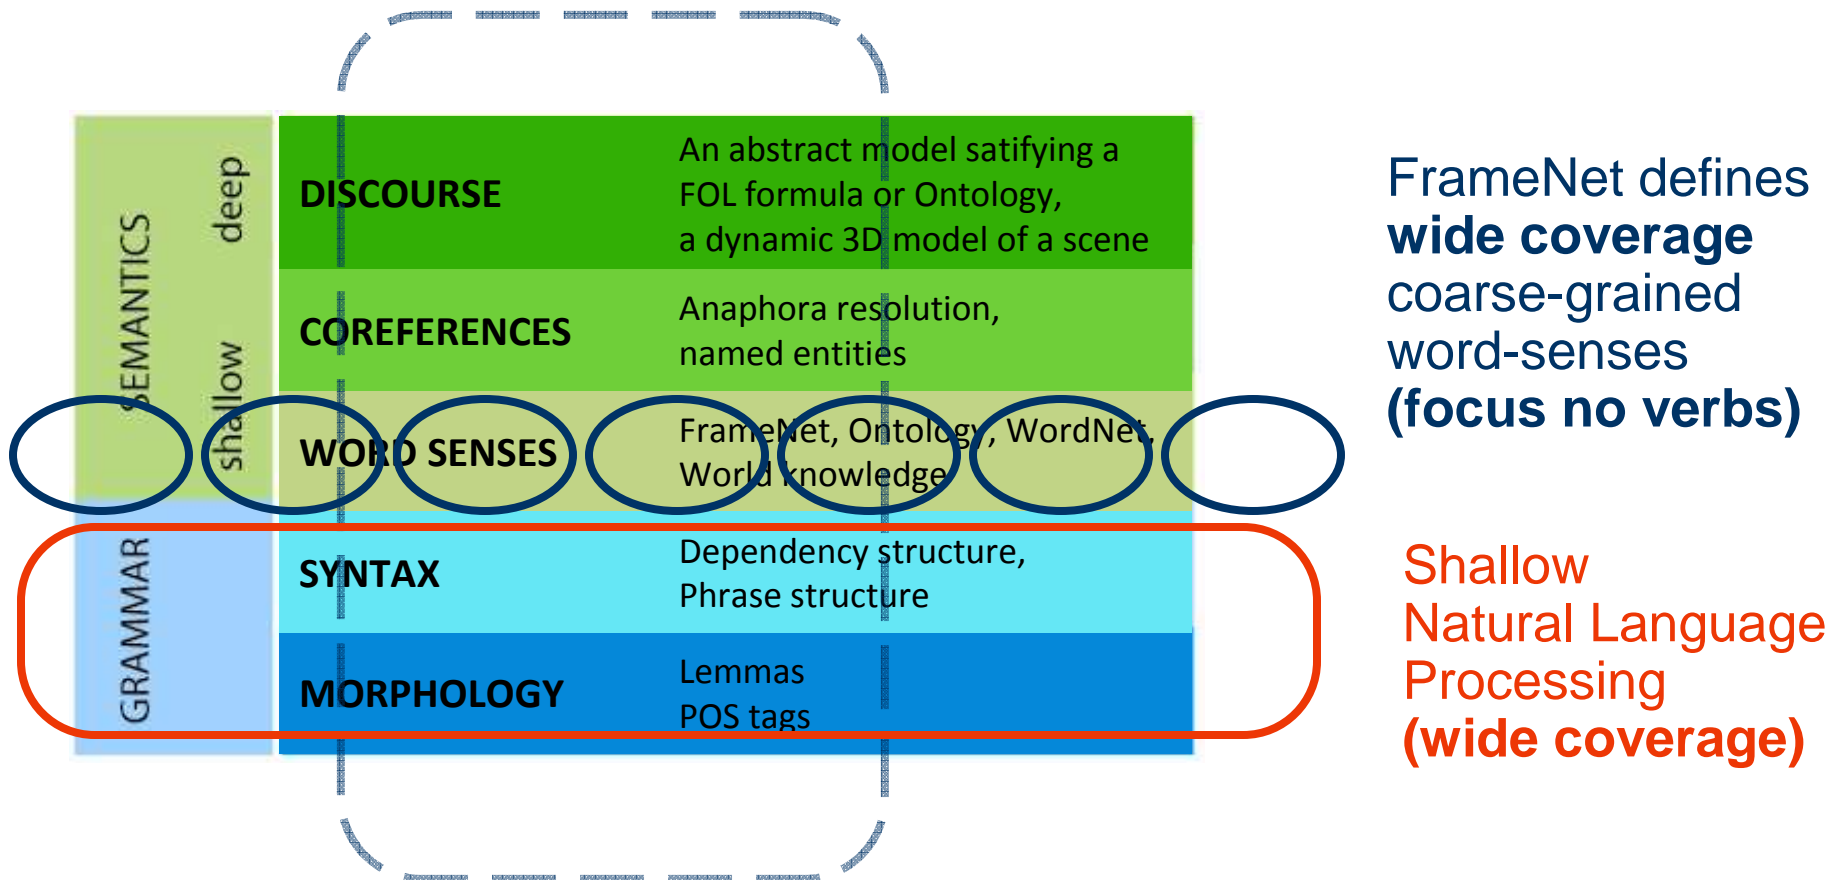

Theme [Theme]

Semantic Type Physical_object

The objects being carried.

Karl **TOTED** the books to the car.

When FrameNet meets a Controlled Natural Language

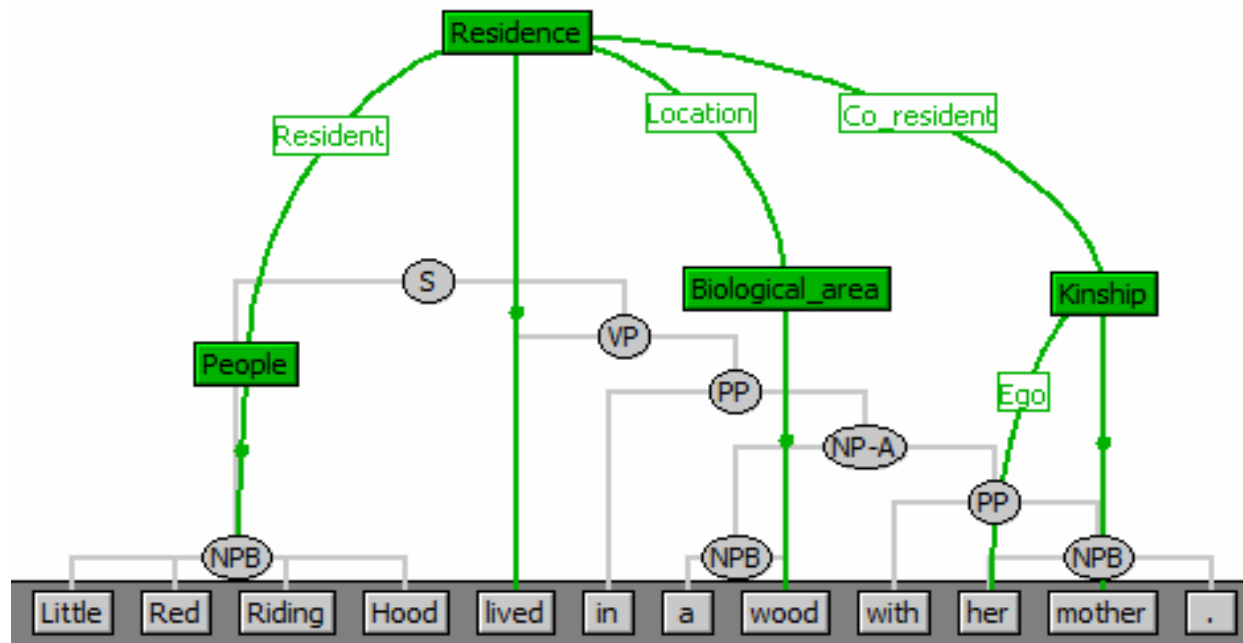

FrameNet defines **wide coverage** coarse-grained word-senses (**focus no verbs**)

Shallow Natural Language Processing (**wide coverage**)

A CNL based on FrameNet would be coarse-grained, but could enable wide coverage deep processing

FrameNet CNL (informal definition)

- **FrameNet CNL:** text that 100% maps into **sequential** FrameNet SITUATION frames (and OBJECT frames)

- **No ambiguity:** fixed terminology lexemes enable **anaphora** resolution and 3D visualisation
- **No temporal/intensional/modal/conditional** operators: *could, if, thus...*
- **No terminology definitions**, assumptions: *apple is a fruit,...*
- **No plural, quantification**

Children at ~3 years generally do not use these unsupported features

Example of FrameNet CNL text

FrameNet annotation
+ anaphora resolution

1. Little Red Riding Hood

2. lived

3. in a wood

4. with her mother.

5. She baked

        (not(stores ?agent ?theme))
        (not(stores ?a ?agent)))
:lexicalUnits (bring, carry, convey, drive, haul, take)
```

Role of PDDL and Situation Calculus

- Planning Domain Description Language (PDDL), for STRIPS-like planning problems
 - Developed by Drew McDermott for planning competitions
 - Central concepts are OBJECTS and ACTIONS
 - ACTIONS have *precondition* and *effect*
 - Planning problem: given an initial and *goal* states, find a sequence of actions (*plan*) leading from initial to goal state
- PDDL role in PAO CNL
 - Mapping of OBJECTS and sequential FrameNet SITUATIONS into PDDL language
 - Planning in PAO is needed to fill-in missing actions not explicitly mentioned in the text, but assumed implicitly (e.g., “John eats an apple”, implicitly means that John picked an apple before that)
 - FrameNet situation semantics → situation calculus (PDDL)

Bringing

Definition:

This frame concerns the movement of a **Theme** and an **Agent** and/or **Carrier**. The **Agent**, a person or other sentient entity, controls the shared **Path** by moving the **Theme** during the motion. In other words, the **Agent** has overall motion in directing the motion of the **Theme**. The **Carrier** may be a separate entity, or it may be the **Agent**'s body. The **Constant location** may be a subregion of the **Agent**'s body or (a subregion of) a vehicle that the **Agent** uses.

Karl CARRIED the books across campus to the library on his head.

Karl CARRIED the books across campus to the library in his truck.

Karl CARRIED the books across campus to the library by truck.

The truck CARRIED the books across campus to the library in specially designed boxes.

The FEs include **Path**, **Goal**, and **Source**. **Area** is an area that contains the motion when the path is understood as irregular. This frame emphasizes the path of movement as opposed to the FEs **Source** or **Goal** as in **Filling** or **Placing**.

FEs:

Core:

Agent [Agt]
Semantic Type Sentient
The **Agent** is a sentient being who physically controls the movement of the **Theme** via carrier, accompanying the **Theme**.

Karl CARRIED the books across the campus to the library.

Area [Area]
Area is used for descriptions of a general area in which the carrying action takes place when the motion is understood to be irregular or not to consist of a single, linear path.

Carrier [Car]
The **Carrier** provides support for the **Theme**. Movement of the **Carrier** results in movement of the **Theme**.
The boat FERRIED the troops across the river.

Goal [goal]
Semantic Type Goal
Goal identifies the endpoint of the path.

Karl CARRIED the books to the library.

Path [Path]
Path along which carrying occurs.

Karl CARRIED the books across the campus.

Source [sou]
Semantic Type Source
Source indicates the beginning of the path along which the **Theme** travels.

Karl HAULED the books from the library to the office.

Theme [Theme]
Semantic Type Physical_object
The objects being carried.

Karl TOTED the books to the car.

PDDL:

(:action bringing

:parameters (?agent ?goal ?theme)

:precondition (and(stores ?agent ?theme)

(stores ?a ?agent) (not(= ?a ?goal)))

:effect (and(stores ?goal ?theme)(stores ?goal ?agent)

(not(stores ?agent ?theme))

(not(stores ?a ?agent)))

Query Answering in PAO

1. Who delivered a basket to a granny?

```
1. SELECT ?x
WHERE-AT-STEP(?n) {?w <stores> ?x. ?x <stores> ?y.}
WHERE-AT-STEP(?n+1) {
  ?z <stores> ?x. ?z <stores> ?y.
  ?y <rdf:type> <fd:Basket>.
  ?z <rdf:type> <pp:Granny>} ANSWER: ?x = obj4
```

2. Did LittleRedRidingHood visit her granny?

```
2. SELECT * WHERE-AT-STEP(any) {
  ?z <stores> ?x.
  ?x <rdf:type> <pp:LittleRedRidingHood>.
  ?z <rdf:type> <pp:Granny>} ANSWER: yes
```

3. Where initially was the basket?

```
3. SELECT ?x WHERE-AT-STEP(min) {
  ?x <stores> ?y.
  ?y <rdf:type> <fd:Basket>} ANSWER: ?x = obj8
```

4. When did the granny get the basket?

```
4. SELECT ?n WHERE-AT-STEP(?n) {
  ?y <stores> ?x.
  ?x <rdf:type> <fd:Basket>.
  ?y <rdf:type> <pp:Granny> } ANSWER: ?n = H
```

Query Answering in PAO

1. Who delivered a basket to a granny? *LittleRedRidingHood [delivered a basket to granny].*
ANSWER: ?x = obj4
2. Did LittleRedRidingHood visit her granny? *Yes [, LittleRedRidingHood visited granny].*
ANSWER: yes
3. Where initially was the basket? *[Basket initially was] in the farmhouse.*
ANSWER: ?x = obj8
4. When did the granny get the basket? *In step H [, when LittleRedRidingHood brought the basket to granny].* ANSWER: ?n = H

Dynamic 3D Visualisation with Physics Simulation

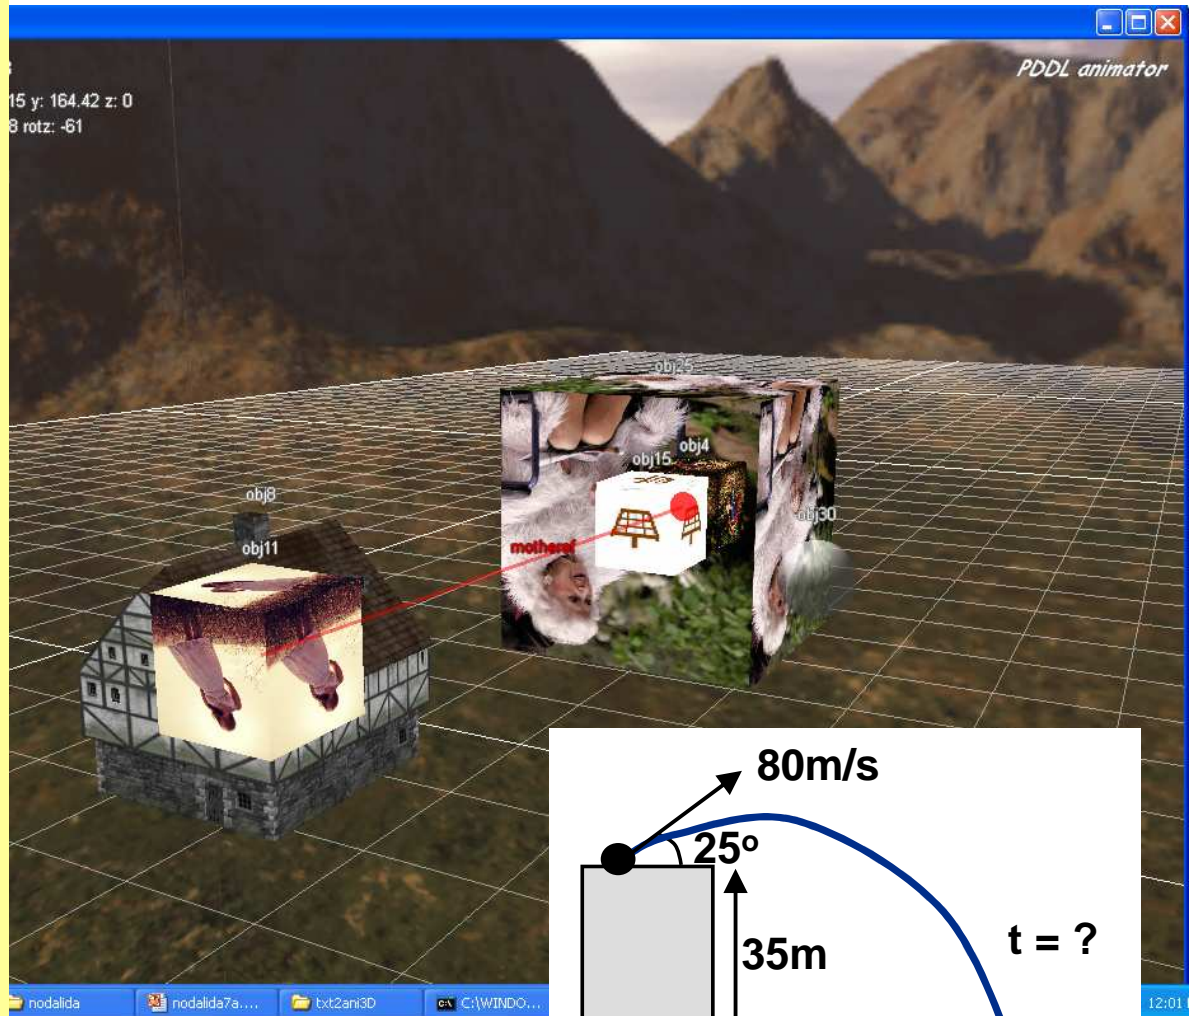

A question from the Advanced Placement Exam in physics:

A ball is thrown upward from the top of a 35m tower with an initial velocity of 80 m/s at an angle of 25 degrees. Find the time the ball is in the air.

Restated in controlled English (CPL):

A ball is thrown. The initial vertical position of the throw is 35 m. The initial velocity of the throw is 80 m/s. The direction of the initial velocity of the throw is 25 degrees. The final vertical position of the throw is 0 m. What is the duration of the throw?

$$d = vt - \left(\frac{1}{2}\right) \cdot gt^2$$

Conclusion

- PAO (FrameNet) CNL is not yet formally defined, nor implemented apart from the informal examples demonstrated
- FrameNet has a great potential for creating a coarse-grained wide coverage CNL for deep semantic processing at discourse level
- Some limitations of the proposed approach are listed on Slide 11.(e.g. only simple sequence of events in the discourse currently supported)

Thank you!
